

## ABSTRACT

An animal call having a first generator connected to a second sound generator. The second sound generator may be removably engaged to the first sound generator. The first sound generator and/or the second sound generator may be manually actuated. The first sound generator and/or the second sound generator may have a reed. Actuation causes the reed to vibrate thus producing a noise. The first sound generator may be actuated by turning the animal call over and back. The second sound generator may be actuated by forcing air through the second sound generator.
